Dual Fan Reverse Airflow

The Fuma 2 CPU Cooler features two fans, a Kaze Flex 120 and a Kaze Flex Slim 120, which rotate in opposite directions. This creates a higher static pressure as well as an increased and more stable air flow. Both fans use a sealed fluid bearing (Sealed Precision FDB), which reduces friction and wear to a minimum thanks to a special oil film. Rubberized pads have a decoupling effect and prevent the transmission of vibrations.

Asymmetrical Design

The classic twin-tower layout of the Fuma 2 is not centered directly above the CPU socket, but slightly offset by arced heatpipes. This asymmetric alignment provides maximum space for the memory slots. The cooling fins of the second tower are designed so that even memory slots on both sides of the CPU socket can be easily operated without limiting the effectiveness of the heatsink. Despite the enormous cooling surface the Fuma 2 remains at a height of 154.5 mm and therefore fits into most standard PC case.

Hyper Precision Mounting System III

The Fuma 2 CPU Cooler uses the proven H.P.M.S III mounting system. A pre-assembled mounting bar with spring-loaded screws ensures balanced pressure distribution. During the installation process, the flexible backplate is securely fixed to the mainboard by rubberized spacers, making the process considerably easier. The mounting system offers full compatibility with all common sockets including AMD's AM4 and Intel's LGA 2066.
