

Preliminary

240pin Registered DIMM based on 4Gb D-die

1.35V

78FBGA with Lead-Free & Halogen-Free
(RoHS compliant)

CAUTION :

This document includes some items still under discussion in JEDEC.

Therefore, those may be changed without pre-notice based on JEDEC progress.

In addition, it is highly recommended that you not send specs without Samsung's permission.

| | | | V _{DDSPD} | SPD Power | 1 |
| | | | | Total | 240 |

NOTE :

*The V_{DD} and V_{DDQ} pins are tied common to a single power-plane on these designs.

6. ON DIMM Thermal Sensor

NOTE : 1. All Samsung RDIMM support Thermal sensor on DIMM

2. When the SPD and the thermal sensor are placed on the module, R1 is placed but R2 is not.
When only the SPD is placed on the module, R2 is placed but R1 is not.

[Table 1] Temperature Sensor Characteristics

| Grade | Range | Temperature Sensor Accuracy | | | Units | NOTE |

| Resolution | | 0.25 | | | °C /LSB | - |

7. Input/Output Functional Description

| Symbol | Type | Polarity | Function |
|--|------------------|---------------|---|
| CK0 | Input | Positive Edge | Positive line of the differential pair of system clock inputs that drives input to the on-DIMM Clock Driver. |
| $\overline{\text{CK0}}$ | Input | Negative Edge | Negative line of the differential pair of system clock inputs that drives the input to the on-DIMM Clock Driver. |
| CKE[1:0] | Input | Active High | CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers of the SDRAMs. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER DOWN (row ACTIVE in any bank) |
| $\overline{\text{S}}[3:0]$ | Input | Active Low | Enables the associated SDRAM command decoder when low and disables decoder when high. When decoder is disabled, new commands are ignored and previous operations continue. These input signals also disable all outputs (except CKE and ODT) of the register(s) on the DIMM when both inputs are high. When both S[1:0] are high, all register outputs (except CKE, ODT and Chip select) remain in the previous state. For modules supporting 4 ranks, S[3:2] operate similarly to S[1:0] for a second set of register outputs. |
| ODT[1:0] | Input | Active High | On-Die Termination control signals |
| $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$ | Input | Active Low | When sampled at the positive rising edge of the clock, $\overline{\text{CAS}}$, $\overline{\text{RAS}}$, and $\overline{\text{WE}}$ define the operation to be executed by the SDRAM. |
| V _{REFDQ} | Supply | | Reference voltage for DQ0-DQ63 and CB0-CB7 |
| V _{REFCA} | Supply | | Reference voltage for A0-A15, BA0-BA2, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$, $\overline{\text{S0}}$, $\overline{\text{S1}}$, CKE0, CKE1, Par_In, ODT0 and ODT1. |
| BA[2:0] | Input | | Selects which SDRAM bank of eight is activated. BA0 - BA2 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines mode register is to be accessed during an MRS cycle. |
| A[15:13, 12/BC, 11, 10/AP, 9:0] | Input | | Provided the row address for Active commands and the column address and Auto Precharge bit for Read/Write commands to select one location out of the memory array in the respective bank. A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA. A12 is also utilized for BL 4/8 identification for "BL on the fly" during CAS command. The address inputs also provide the op-code during Mode Register Set commands. |
| DQ[63:0], CB[7:0] | I/O | | Data and Check Bit Input/Output pins |
| DM[8:0] | | | Active High Masks write data when high, issued concurrently with input data. V _{DD} , V _{SS} Supply Power and ground for the DDR SDRAM input buffers and core logic. V _{TT} Supply Termination Voltage for Address/Command/Control/Clock nets. |
| DQS[17:0] | I/O | | Positive Edge Positive line of the differential data strobe for input and output data. |
| $\overline{\text{DQS}}$ [17:0] | I/O | | Negative Edge Negative line of the differential data strobe for input and output data. |
| TDQS[17:9], $\overline{\text{TDQS}}$ [17:9] | OUT | | TDQS/ $\overline{\text{TDQS}}$ is applicable for X8 DRAMs only. When enabled via Mode Register A11=1 in MR1, DRAM will enable the same termination resistance function on TDQS/ $\overline{\text{TDQS}}$ that is applied to DQS/ $\overline{\text{DQS}}$. When disabled via mode register A11=0 in MR1, DM/ $\overline{\text{TDQS}}$ will provide the data mask function and TDQS is not used. X4/X16 DRAMs must disable the TDQS function via mode register A11=0 in MR1 |
| SA[2:0] | IN | | These signals are tied at the system planar to either V _{SS} or V _{DDSPD} to configure the serial SPD EEPROM address range. |
| SDA | I/O | | This bidirectional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to V _{DDSPD} on the system planar to act as a pull-up. |
| SCL | IN | | This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to V _{DDSPD} on the system planar to act as a pull-up. |
| $\overline{\text{EVENT}}$ | OUT (open drain) | Active Low | This signal indicates that a thermal event has been detected in the thermal sensing device. The system should guarantee the electrical level requirement is met for the $\overline{\text{EVENT}}$ pin on TS/SPD part. |
| V _{DDSPD} | Supply | | Serial EEPROM positive power supply wired to a separate power pin at the connector which supports from 3.0 Volt to 3.6 Volt (nominal 3.3V) operation. |
| $\overline{\text{RESET}}$ | IN | | The $\overline{\text{RESET}}$ pin is connected to the $\overline{\text{RESET}}$ pin on the register and to the $\overline{\text{RESET}}$ pin on the DRAM. When low, all register outputs will be driven low and the Clock Driver clocks to the DRAMs and register(s) will be set to low level (the Clock Driver will remain synchronized with the input clock) |
| Par_In | IN | | Parity bit for the Address and Control bus. ("1 " : Odd, "0 " : Even) |
| $\overline{\text{Err_Out}}$ | OUT (open drain) | | Parity error detected on the Address and Control bus. A resistor may be connected from $\overline{\text{Err_Out}}$ bus line to V _{DD} on the system planar to act as a pull up. |
| TEST | | | Used by memory bus analysis tools (unused (NC) on memory DIMMs) |

8. Pinout Comparison Based On Module Type

| $\overline{\text{Pin}}$ | RDIMM | | UDIMM | |
|---|--|---|-------------------------|--|
| | Signal | NOTE | Signal | NOTE |
| 48, 49 | V_{TT} | Additional connection for Termination Voltage for Address/Command/Control/Clock nets. | NC | Not used on UDIMMs |
| 120, 240 | V_{TT} | Termination Voltage for Address/Command/Control/Clock nets. | V_{TT} | Termination Voltage for Address/Command/Control/Clock nets. |

1. Unless otherwise noted, resistor values are $15\Omega \pm 5\%$.
2. See the wiring diagrams for all resistors associated with the command, address and control bus.
3. ZQ resistors are $240\Omega \pm 1\%$. For all other resistor values refer to the appropriate wiring diagram.

NOTE 1. CK0_t and CK_0 are differentially terminated with a single 120Ω ± 5% resistor
 NOTE 2. CK0_t and CK_0 are differentially terminated with a single 120Ω ± 5% resistor, but is not used
 NOTE 3. Unused register inputs ODT1 for Register A and ODT0 for Register B are tied to ground.

11. Absolute Maximum Ratings

11.1 Absolute Maximum DC Ratings

| Symbol | Parameter | Rating | Units | NOTE |
|-------------------|---|-----------------|-------|------|
| V_{DD} | Voltage on V_{DD} pin relative to V_{SS} | -0.4 V ~ 1.80 V | V | 1,3 |
| V_{DDQ} | Voltage on V_{DDQ} pin relative to V_{SS} | -0.4 V ~ 1.80 V | V | 1,3 |
| V_{IN}, V_{OUT} | Voltage on any pin relative to V_{SS} | -0.4 V ~ 1.80 V | V | 1 |
| T_{STG} | Storage Temperature | -55 to +100 | °C | 1, 2 |

NOTE :

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
- V_{DD} and V_{DDQ} must be within 300mV of each other at all times; and V_{REF} must be not greater than $0.6 \times V_{DDQ}$. When V_{DD} and V_{DDQ} are less than 500mV; V_{REF} may be equal to or less than 300mV.

11.2 DRAM Component Operating Temperature Range

| Symbol | Parameter | rating | Unit | NOTE |
|------------|-----------------------------|---------|------|---------|
| T_{OPER} | Operating Temperature Range | 0 to 95 | °C | 1, 2, 3 |

NOTE :

- Operating Temperature T_{OPER} is the case surface temperature on the center/top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0-85°C under all operating conditions
- Some applications require operation of the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
 - Refresh commands must be doubled in frequency, therefore reducing the refresh interval $tREFI$ to 3.9 μ s.
 - If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b), in this case I_{DD6} current can be increased around 10~20% than normal Temperature range.

12. AC & DC Operating Conditions

12.1 Recommended DC Operating Conditions

| Symbol | Parameter | Operation Voltage | Rating | | | Units | NOTE |
|-----------|---------------------------|-------------------|--------|------|-------|-------|---------|
| | | | Min. | Typ. | Max. | | |
| V_{DD} | Supply Voltage | 1.35V | 1.283 | 1.35 | 1.45 | V | 1, 2, 3 |
| | | 1.5V | 1.425 | 1.5 | 1.575 | V | 1, 2, 3 |
| V_{DDQ} | Supply Voltage for Output | 1.35V | 1.283 | 1.35 | 1.45 | V | 1, 2, 3 |
| | | 1.5V | 1.425 | 1.5 | 1.575 | V | 1, 2, 3 |

NOTE:

- Under all conditions V_{DDQ} must be less than or equal to V_{DD} .
- V_{DDQ} tracks with V_{DD} . AC parameters are measured with V_{DD} and V_{DDQ} tied together.
- V_{DD} & V_{DDQ} rating are determined by operation voltage.

13.2 V_{REF} Tolerances

The dc-tolerance limits and ac-noise limits for the reference voltages V_{REFCA} and V_{REFDQ} are illustrate in Figure 1. It shows a valid reference voltage $V_{REF}(t)$ as a function of time. (V_{REF} stands for V_{REFCA} and V_{REFDQ} likewise).

$V_{REF}(DC)$ is the linear average of $V_{REF}(t)$ over a very long period of time (e.g. 1 sec). This average has to meet the min/max requirements of V_{REF} . Furthermore $V_{REF}(t)$ may temporarily deviate from $V_{REF}(DC)$ by no more than $\pm 1\% V_{DD}$.

Figure 1. Illustration of $V_{REF}(DC)$ tolerance and V_{REF} ac-noise limits

The voltage levels for setup and hold time measurements $V_{IH}(AC)$, $V_{IH}(DC)$, $V_{IL}(AC)$ and $V_{IL}(DC)$ are dependent on V_{REF} .

" V_{REF} " shall be understood as $V_{REF}(DC)$, as defined in Figure 1.

This clarifies, that dc-variations of V_{REF} affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for $V_{REF}(DC)$ deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with V_{REF} ac-noise. Timing and voltage effects due to ac-noise on V_{REF} up to the specified limit ($\pm 1\%$ of V_{DD}) are included in DRAM timings and their associated deratings.

- NOTE :**
- Used to define a differential signal slew-rate.
 - for CK - CK-bar use $V_{IH}/V_{IL}(AC)$ of ADD/CMD and V_{REFCA} ; for DQS - DQS-bar use $V_{IH}/V_{IL}(AC)$ of DQs and V_{REFDQ} ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
 - These values are not defined, however they single-ended signals CK, CK-bar, DQS, DQS-bar need to be within the respective limits ($V_{IH}(DC)$ max, $V_{IL}(DC)$ min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "overshoot and Undersheet Specification"

13.3.3 Single-ended Requirements for Differential Signals

Each individual component of a differential signal (CK, DQS, $\overline{\text{CK}}$, $\overline{\text{DQS}}$) has also to comply with certain requirements for single-ended signals.

CK and $\overline{\text{CK}}$ have to approximately reach $V_{\text{SEHmin}} / V_{\text{SELmax}}$ (approximately equal to the ac-levels ($V_{\text{IH}}(\text{AC}) / V_{\text{IL}}(\text{AC})$) for ADD/CMD signals) in every half-cycle.

DQS, $\overline{\text{DQS}}$ have to reach $V_{\text{SEHmin}} / V_{\text{SELmax}}$ (approximately the ac-levels ($V_{\text{IH}}(\text{AC}) / V_{\text{IL}}(\text{AC})$) for DQ signals) in every half-cycle proceeding and following a valid transition.

Note that the applicable ac-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g. if $V_{\text{IH150}}(\text{AC})/V_{\text{IL150}}(\text{AC})$ is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals CK and $\overline{\text{CK}}$.

Figure 3. Single-ended requirement for differential signals

Note that while ADD/CMD and DQ signal requirements are with respect to V_{REF} , the single-ended components of differential signals have a requirement with respect to $V_{\text{DD}}/2$; this is nominally the same. The transition of single-ended signals through the ac-levels is used to measure setup time. For single-ended components of differential signals the requirement to reach V_{SELmax} , V_{SEHmin} has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

[Table 8] Single ended levels for CK, DQS, $\overline{\text{CK}}$, $\overline{\text{DQS}}$

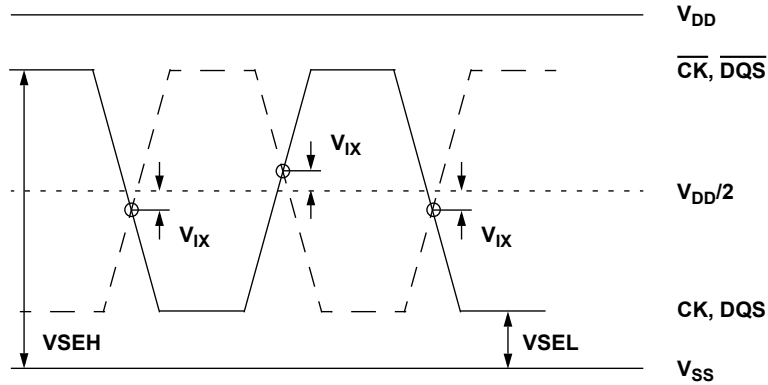

| Symbol | Parameter | DDR3-800/1066/1333/1600 | | Unit | NOTE |
|------------------|--|---------------------------|---------------------------|------|------|
| | | Min | Max | | |
| V_{SEH} | Single-ended high-level for strobes | $(V_{\text{DD}}/2)+0.175$ | NOTE 3 | V | 1, 2 |
| | Single-ended high-level for CK, $\overline{\text{CK}}$ | $(V_{\text{DD}}/2)+0.175$ | NOTE 3 | V | 1, 2 |
| V_{SEL} | Single-ended low-level for strobes | NOTE 3 | $(V_{\text{DD}}/2)-0.175$ | V | 1, 2 |
| | Single-ended low-level for CK, $\overline{\text{CK}}$ | NOTE 3 | $(V_{\text{DD}}/2)-0.175$ | V | 1, 2 |

NOTE :

- For CK, $\overline{\text{CK}}$ use $V_{\text{IH}}/V_{\text{IL}}(\text{AC})$ of ADD/CMD; for strobes (DQS, $\overline{\text{DQS}}$) use $V_{\text{IH}}/V_{\text{IL}}(\text{AC})$ of DQs.
- $V_{\text{IH}}(\text{AC})/V_{\text{IL}}(\text{AC})$ for DQs is based on V_{REFDQ} ; $V_{\text{IH}}(\text{AC})/V_{\text{IL}}(\text{AC})$ for ADD/CMD is based on V_{REFCA} ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here
- These values are not defined, however the single-ended signals CK, $\overline{\text{CK}}$, DQS, $\overline{\text{DQS}}$ need to be within the respective limits ($V_{\text{IH}}(\text{DC})$ max, $V_{\text{IL}}(\text{DC})$ min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specification"

13.3.4 Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK, $\overline{\text{CK}}$ and DQS, $\overline{\text{DQS}}$) must meet the requirements in below table. The differential input cross point voltage V_{IX} is measured from the actual cross point of true and complement signal to the mid level between of V_{DD} and V_{SS} .

Figure 4. V_{IX} Definition

[Table 9] Cross point voltage for differential input signals (CK, DQS) : 1.35V

| Symbol | Parameter | DDR3L-800/1066/1333/1600 | | Unit | NOTE |
|----------|--|--------------------------|-----|------|------|
| | | Min | Max | | |
| V_{IX} | Differential Input Cross Point Voltage relative to $V_{DD}/2$ for CK, $\overline{\text{CK}}$ | -150 | 150 | mV | 1 |
| V_{IX} | Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS, $\overline{\text{DQS}}$ | -150 | 150 | mV | |

NOTE :

1. The relation between V_{ix} Min/Max and V_{SEL}/V_{SEH} should satisfy following.

$$(V_{DD}/2) + V_{ix}(\text{Min}) - V_{SEL} \geq 25\text{mV}$$

$$V_{SEH} - ((V_{DD}/2) + V_{ix}(\text{Max})) \geq 25\text{mV}$$

[Table 10] Cross point voltage for differential input signals (CK, DQS) : 1.5V

| Symbol | Parameter | DDR3-800/1066/1333/1600 | | Unit | NOTE |
|----------|--|-------------------------|-----|------|------|
| | | Min | Max | | |
| V_{IX} | Differential Input Cross Point Voltage relative to $V_{DD}/2$ for CK, $\overline{\text{CK}}$ | -150 | 150 | mV | |
| V_{IX} | Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS, $\overline{\text{DQS}}$ | -175 | 175 | mV | 1 |
| V_{IX} | Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS, $\overline{\text{DQS}}$ | -150 | 150 | mV | |

NOTE :

1. Extended range for V_{IX} is only allowed for clock and if single-ended clock input signals CK and $\overline{\text{CK}}$ are monotonic, have a single-ended swing V_{SEL} / V_{SEH} of at least $V_{DD}/2 \pm 250$ mV, and the differential slew rate of CK- $\overline{\text{CK}}$ is larger than 3 V/ ns.

13.4 Slew Rate Definition for Single Ended Input Signals

See "Address / Command Setup, Hold and Derating" for single-ended slew rate definitions for address and command signals.
See "Data Setup, Hold and Slew Rate Derating" for single-ended slew rate definitions for data signals.

13.5 Slew rate definition for Differential Input Signals

Input slew rate for differential signals (CK, $\overline{\text{CK}}$ and DQS, $\overline{\text{DQS}}$) are defined and measured as shown in below.

[Table 11] Differential input slew rate definition

| Description | Measured | | Defined by |
|--|-----------------|-----------------|---|
| | From | To | |
| Differential input slew rate for rising edge (CK- $\overline{\text{CK}}$ and DQS- $\overline{\text{DQS}}$) | $V_{ILdiffmax}$ | $V_{IHdiffmin}$ | $[V_{IHdiffmin} - V_{ILdiffmax}] / \Delta TRdiff$ |
| Differential input slew rate for falling edge (CK- $\overline{\text{CK}}$ and DQS- $\overline{\text{DQS}}$) | $V_{IHdiffmin}$ | $V_{ILdiffmax}$ | $[V_{IHdiffmin} - V_{ILdiffmax}] / \Delta TFdiff$ |

NOTE : The differential signal (i.e. CK - $\overline{\text{CK}}$ and DQS - $\overline{\text{DQS}}$) must be linear between these thresholds

14. AC & DC Output Measurement Levels

14.1 Single Ended AC and DC Output Levels

[Table 12] Single Ended AC and DC output levels

| Symbol | Parameter | DDR3-800/1066/1333/1600 | Units | NOTE |
|--------------|---|-------------------------------|-------|------|
| $V_{OH(DC)}$ | DC output high measurement level (for IV curve linearity) | $0.8 \times V_{DDQ}$ | V | |
| $V_{OM(DC)}$ | DC output mid measurement level (for IV curve linearity) | $0.5 \times V_{DDQ}$ | V | |
| $V_{OL(DC)}$ | DC output low measurement level (for IV curve linearity) | $0.2 \times V_{DDQ}$ | V | |
| $V_{OH(AC)}$ | AC output high measurement level (for output SR) | $V_{TT} + 0.1 \times V_{DDQ}$ | V | 1 |
| $V_{OL(AC)}$ | AC output low measurement level (for output SR) | $V_{TT} - 0.1 \times V_{DDQ}$ | V | 1 |

NOTE : 1. The swing of $\pm 0.1 \times V_{DDQ}$ is based on approximately 50% of the static single ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$.

14.2 Differential AC and DC Output Levels

[Table 13] Differential AC and DC output levels

|------------------|---|-------------------------|-------|------|
| $V_{OHdiff(AC)}$ | AC differential output high measurement level (for output SR) | $+0.2 \times V_{DDQ}$ | V | 1 |
| $V_{OLdiff(AC)}$ | AC differential output low measurement level (for output SR) | $-0.2 \times V_{DDQ}$ | V | 1 |

NOTE : 1. The swing of $\pm 0.2 \times V_{DDQ}$ is based on approximately 50% of the static single ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$ at each of the differential outputs.

14.3 Single-ended Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between $V_{OL(AC)}$ and $V_{OH(AC)}$ for single ended signals as shown in below.

[Table 14] Single ended Output slew rate definition

| Description | Measured | | Defined by |

se : Single-ended Signals

For Ron = RZQ/7 setting

NOTE : 1) In two cases, a maximum slew rate of 6V/ns applies for a single DQ signal within a byte lane.

- Case_1 is defined for a single DQ signal within a byte lane which is switching into a certain direction (either from high to low or low to high) while all remaining DQ signals in the same byte lane are static (i.e they stay at either high or low).
- Case_2 is defined for a single DQ signals in the same byte lane are switching into the opposite direction (i.e. from low to high or high to low respectively). For the remaining DQ signal switching into the opposite direction, the regular maximum limit of 5 V/ns applies.

NOTE : This parameter is Component Input/Output Capacitance so that is different from Module level Capacitance.

1. Although the DM, TDQS and \overline{TDQS} pins have different functions, the loading matches DQ and DQS

2. This parameter is not subject to production test. It is verified by design and characterization.

The capacitance is measured according to JEP147 ("PROCEDURE FOR MEASURING INPUT CAPACITANCE USING A VECTOR NETWORK ANALYZER (VNA)") with V_{DD} , V_{DDQ} , V_{SS} , V_{SSQ} applied and all other pins floating (except the pin under test, CKE, RESET and ODT as necessary). $V_{DD}=V_{DDQ}=1.5V$ or $1.35V$, $V_{BIAS}=V_{DD}/2$ and on-die termination off.

3. This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here

4. Absolute value of CCK-CCK

5. Absolute value of CIO(DQS)-CIO(\overline{DQS})

6. CI applies to ODT, \overline{CS} , CKE, A0-A15, BA0-BA2, \overline{RAS} , \overline{CAS} , \overline{WE} .

7. CDI_CTRL applies to ODT, \overline{CS} and CKE

8. $CDI_CTRL=CI(CTRL)-0.5*(CI(CLK)+CI(\overline{CLK}))$

9. CDI_ADD_CMD applies to A0-A15, BA0-BA2, \overline{RAS} , \overline{CAS} and \overline{WE}

10. $CDI_ADD_CMD=CI(ADD_CMD) - 0.5*(CI(CLK)+CI(\overline{CLK}))$

11. $CDIO=CIO(DQ,DM) - 0.5*(CIO(DQS)+CIO(\overline{DQS}))$

12. Maximum external load capacitance on ZQ pin: 5pF

18. Electrical Characteristics and AC timing

[0 °C < T_{CASE} ≤ 95 °C, V_{DDQ} = 1.35V(1.28V~1.45V) & 1.5V(1.425V~1.575V); V_{DD} = 1.35V(1.28V~1.45V) & 1.5V(1.425V~1.575V)]

18.3.1 Speed Bin Table Notes

Absolute Specification [T_{OPER} ; $V_{DDQ} = V_{DD} = 1.35V(1.28V\sim 1.45V) \& 1.5V(1.425V\sim 1.575V)$];

NOTE :

1. The CL setting and CWL setting result in tCK(AVG).MIN and tCK(AVG).MAX requirements. When making a selection of tCK(AVG), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. tCK(AVG).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(AVG) value (2.5, 1.875, 1.5, or 1.25 ns) when calculating CL [nCK] = tAA [ns] / tCK(AVG) [ns], rounding up to the next "SupportedCL".
3. tCK(AVG).MAX limits: Calculate tCK(AVG) = tAA.MAX / CL SELECTED and round the resulting tCK(AVG) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is tCK(AVG).MAX corresponding to CL SELECTED.
4. "Reserved" settings are not allowed. User must program a different value.
5. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
6. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
7. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
8. For devices supporting optional downshift to CL=7 and CL=9, tAA/tRCD/tRP min must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1333(CL9) devices supporting downshift to DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600(CL11) devices supporting downshift to DDR3-1333(CL9) or DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accordingly. For example, 49.125ns (tRASmin + tRPmin=36ns+13.125ns) for DDR3-1333(CL9) and 48.125ns (tRASmin+tRPmin=35ns+13.125ns) for DDR3-1600(CL11).

19.1 Jitter Notes

- Specific Note a** Unit 'tCK(avg)' represents the actual tCK(avg) of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges.ex) tMRD = 4 [nCK] means; if one Mode Register Set command is registered at Tm, another Mode Register Set command may be registered at Tm+4, even if (Tm+4 - Tm) is 4 x tCK(avg) + tERR(4per),min.
- Specific Note b** These parameters are measured from a command/address signal (CKE, \overline{CS} , \overline{RAS} , \overline{CAS} , \overline{WE} , ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK/ \overline{CK}) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note c** These parameters are measured from a data strobe signal (DQS, \overline{DQS}) crossing to its respective clock signal (CK, \overline{CK}) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
- Specific Note d** These parameters are measured from a data signal (DM, DQ0, DQ1, etc.) transition edge to its respective data strobe signal (DQS, \overline{DQS}) crossing.
- Specific Note e** For these parameters, the DDR3 SDRAM device supports tPARAM [nCK] = RU{ tPARAM [ns] / tCK(avg) [ns] }, which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support tRP = RU{tRP / tCK(avg)}, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which tRP = 15ns, the device will support tRP = RU{tRP / tCK(avg)} = 6, as long as the input clock jitter specifications are met, i.e. Precharge command at Tm and Active command at Tm+6 is valid even if (Tm+6 - Tm) is less than 15ns due to input clock jitter.
- Specific Note f** When the device is operated with input clock jitter, this parameter needs to be derated by the actual tERR(mper),act of the input clock, where 2 <= m <= 12. (output deratings are relative to the SDRAM input clock.)
For example, if the measured jitter into a DDR3-800 SDRAM has tERR(mper),act,min = - 172 ps and tERR(mper),act,max = + 193 ps, then tDQSCK,min(derated) = tDQSCK,min - tERR(mper),act,max = - 400 ps - 193 ps = - 593 ps and tDQSCK,max(derated) = tDQSCK,max - tERR(mper),act,min = 400 ps + 172 ps = + 572 ps. Similarly, tLZ(DQ) for DDR3-800 derates to tLZ(DQ),min(derated) = - 800 ps - 193 ps = - 993 ps and tLZ(DQ),max(derated) = 400 ps + 172 ps = + 572 ps. (Caution on the min/max usage!)
Note that tERR(mper),act,min is the minimum measured value of tERR(nper) where 2 <= n <= 12, and tERR(mper),act,max is the maximum measured value of tERR(nper) where 2 <= n <= 12.
- Specific Note g** When the device is operated with input clock jitter, this parameter needs to be derated by the actual tJIT(per),act of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR3-800 SDRAM has tCK(avg),act = 2500 ps, tJIT(per),act,min = - 72 ps and tJIT(per),act,max = + 93 ps, then tRPRE,min(derated) = tRPRE,min + tJIT(per),act,min = 0.9 x tCK(avg),act + tJIT(per),act,min = 0.9 x 2500 ps - 72 ps = + 2178 ps. Similarly, tQH,min(derated) = tQH,min + tJIT(per),act,min = 0.38 x tCK(avg),act + tJIT(per),act,min = 0.38 x 2500 ps - 72 ps = + 878 ps. (Caution on the min/max usage!)

19.2 Timing Parameter Notes

1. Actual value dependant upon measurement level definitions which are TBD.
2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
3. The max values are system dependent.
4. WR as programmed in mode register
5. Value must be rounded-up to next higher integer value
6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, tREFI.
7. For definition of RTT turn-on time tAON see "Device Operation & Timing Diagram Datasheet"
8. For definition of RTT turn-off time tAOF see "Device Operation & Timing Diagram Datasheet".
9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.
10. WR in clock cycles as programmed in MR0
11. The maximum read postamble is bound by tDQSCK(min) plus tQSH(min) on the left side and tHZ(DQS)max on the right side. See "Device Operation & Timing Diagram Datasheet".
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD
13. Value is only valid for RON34
14. Single ended signal parameter. Refer to chapter 8 and chapter 9 for definition and measurement method.
15. tREFI depends on T_{OPER}
16. tIS(base) and tIH(base) values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, $\overline{\text{CK}}$ differential slew rate, Note for DQ and DM signals, $V_{\text{REF}}(\text{DC}) = V_{\text{REFDQ}}(\text{DC})$. For input only pins except RESET, $V_{\text{REF}}(\text{DC}) = V_{\text{REFCA}}(\text{DC})$. See "Address/Command Setup, Hold and Derating" on component datasheet.
17. tDS(base) and tDH(base) values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, $\overline{\text{DQS}}$ differential slew rate. Note for DQ and DM signals, $V_{\text{REF}}(\text{DC}) = V_{\text{REFDQ}}(\text{DC})$. For input only pins except RESET, $V_{\text{REF}}(\text{DC}) = V_{\text{REFCA}}(\text{DC})$. See "Data Setup, Hold and Slew Rate Derating" on component datasheet.
18. Start of internal write transaction is defined as follows ;
For BL8 (fixed by MRS and on-the-fly) : Rising clock edge 4 clock cycles after WL.
For BC4 (on-the-fly) : Rising clock edge 4 clock cycles after WL
For BC4 (fixed by MRS) : Rising clock edge 2 clock cycles after WL
19. The maximum read preamble is bound by tLZDQS(min) on the left side and tDQSCK(max) on the right side. See "Device Operation & Timing Diagram Datasheet"
20. CKE is allowed to be registered low while operations such as row activation, precharge, autorecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
21. Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXPDLL(min) is also required. See "Device Operation & Timing Diagram Datasheet".
22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
23. One ZQCS command can effectively correct a minimum of 0.5 % (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other application specific parameters. One method for calculating the interval between ZQCS commands, given the temperature (Tdriftrate) and voltage (Vdriftrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$\frac{\text{ZQCorrection}}{(\text{TSens} \times \text{Tdriftrate}) + (\text{VSens} \times \text{Vdriftrate})}$$

where TSens = max(dRTTdT, dRONdTM) and VSens = max(dRTTdV, dRONdVM) define the SDRAM temperature and voltage sensitivities.

For example, if TSens = 1.5% /°C, VSens = 0.15% / mV, Tdriftrate = 1°C / sec and Vdriftrate = 15 mV / sec, then the interval between ZQCS commands is calculated as:

$$\frac{0.5}{(1.5 \times 1) + (0.15 \times 15)} = 0.133 \approx 128\text{ms}$$

24. n = from 13 cycles to 50 cycles. This row defines 38 parameters.
25. tCH(abs) is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
26. tCL(abs) is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.
27. The tIS(base) AC150 specifications are adjusted from the tIS(base) specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150 mV and another 25 ps to account for the earlier reference point [(175 mv - 150 mV) / 1 V/ns].
28. Pulse width of a input signal is defined as the width between the first crossing of V_{REF}(DC) and the consecutive crossing of V_{REF}(DC)
29. tDQSL describes the instantaneous differential input low pulse width on DQS- $\overline{\text{DQS}}$, as measured from one falling edge to the next consecutive rising edge.
30. tDQSH describes the instantaneous differential input high pulse width on DQS- $\overline{\text{DQS}}$, as measured from one rising edge to the next consecutive falling edge.
31. tDQSH, act + tDQSL, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.
32. tDSH, act + tDSS, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.
