

Venandi Animal

🌿 Premium cat food 🌿

In the footsteps of their ancestors

Natural, real and original.

Our mission

Natural, real, original – that is Venandi. We follow the traces of the ancestors of our house cats and see it as our responsibility to meet their elevated standards.

Therefore, we consider the properties of their digestive system and the requirements of their original nature. Each step of our production process is aligned towards this, beginning with the breeding and selection of our raw materials. We use only native ingredients and a gentle preparation process for the highest-quality and most valuable food possible that provides our cats with all the necessary nutrients.

To this end, we use 100% fresh premium quality meat and do not use:

- ✕ grain and gluten
- ✕ soya
- ✕ artificial colourings
- ✕ plant by-products
- ✕ synthetic preservatives
- ✕ synthetic binding agents
- ✕ other artificial additives

At Venandi, we have made it our aim to meet the physiological needs of our house cats in the best way possible. Natural ingredients – real raw materials – original compositions.

Production – wet food

We aim to provide complete food of the highest possible quality. Therefore, we obtain only the best ingredients from regional and sustainable cultivation. Even the breeding and the raw materials produced are subject to regular, strict checks in harmony with the food act. Only real, valuable, premium quality natural products are processed.

During the following production steps, the natural food components are tailored optimally to each other and processed gently, before being filled into tins and sealed air-tight. Due to this process, no chemical additives or synthetic preservatives are required. Additionally, all vitamins and nutrients are preserved in the finished food as well.

Thus, with Venandi, the originality of nature is found in the bowls of our cats, fulfilling all the standards of food that is true-to-nature and appropriate to the species.

For us, quality assurance starts with selecting the raw materials as they are the basis for the end product later. As a result, we use local ingredients from local farmers.

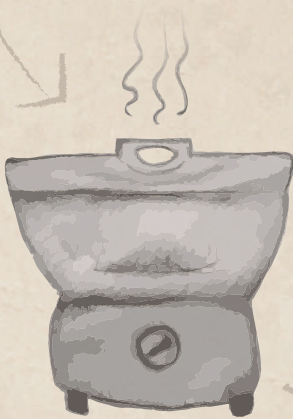

Production – dry food

We aim to provide complete food of the highest possible quality. Therefore, we obtain only the best ingredients from regional and sustainable cultivation. Even the breeding and the raw materials produced are subject to regular, strict checks in harmony with the food act. Only real, valuable, premium quality natural products are processed.

During the following stages of production, the natural food ingredients are first chopped up and then gently cooked with steam. Due to this process, no chemical additives or synthetic preservatives are required. Additionally, the vitamins and nutrients are preserved in the finished food as much as possible.

The dry food is shaped after the cooking process. Steam remains an important part of this production step too – steam makes the croquettes the right shape and size, meaning they are not shaped via mechanical pressure. This process makes it possible for the nutrients contained in the food to be broken down more easily, meaning that the dry food can be easily digested by cats.

Using a double drying process, we ensure that our dry food keeps for longer, even without preservatives. Refinement with high-quality oils also rounds off the taste components in the best possible way. Thus, with Venandi, the originality of nature is found in the bowls of our cats, fulfilling all the standards of food that is true-to-nature and appropriate to the species.

The cat – a history

It is dawn, a gentle breath of wind blows across the grass. It lurks well hidden in the bushes, its ears pricked, its eyes attentive. It locates its prey with its keen sense of smell, observing its every step, waiting for the right moment. Every fibre of its agile, elegant body is on edge, while it creeps up on its prey slowly and as inconspicuously as possible. Step by quiet step. It has its victim exactly in view. Now! It darts powerfully forward, takes the decisive jump and bingo – it has its claws on its prey and eats it with a single bite. The interplay of patience, grace and movement won it a valuable meal. This is how the wild cats hunted several thousand years ago – and our house cats do this in exactly the same way today.

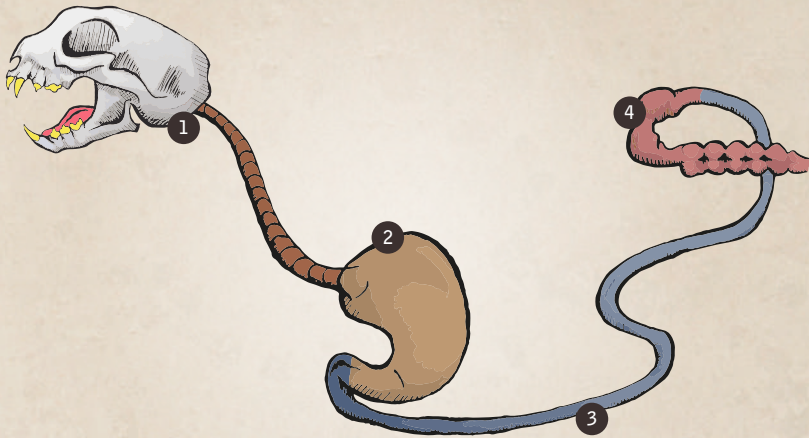

From the granary to the living room

In the course of farming, grain stocks were created that also attracted uninvited guests such as mice and rats. The cat took advantage of this concentrated range of food, which meant that it no longer had to foray for kilometres through its hunting ground to find prey. Additionally, this minimised their risk of becoming victims themselves to larger predators, as these did not come near people. In this way, both parties benefited. People learned to appreciate cats and to tame them, to the degree that cats can be tamed. The cat lovers among us know how stubborn and independent our house cats still are today, even if they very much enjoy our stroking sessions here and there.

However, even though the domesticated house cat attached itself to us humans more than 10,000 years ago, their instincts and natural urge to hunt have hardly changed to this day. In each of our house cats, their ancestry and their abilities are still to be found. Physically, too, cats have changed only marginally in the course of domestication – this also concerns the digestive system and the nutritional needs of our animals. Venandi has made it its aim to meet the physiological needs of our pets in the best way possible.

The cat – digestion

Looking at the cat's natural prey, it is obvious that it is still a carnivore. It eats mainly small mammals such as mice and birds. This is also reflected in the digestive organs. The cat's digestive system is comparatively short and is not designed for the decomposition of plant substances that are hard to digest or grain. It only sometimes consumes a very small proportion of this due to the stomach contents of its prey.

- 1 Head gut: This includes the lips, the oral cavity along with the tongue, the salivary glands, the teeth and the mouth
- 2 Foregut: With the gullet, the abdominal and pelvic cavity as well as the stomach
- 3 Midgut: Corresponds to the small intestine, which is divided into the duodenum, the jejunum and the ileum
- 4 Rectum: Corresponds to the hindgut, which is divided into the caecum, the colon and the rectum

The intestinal appendage glands, such as the liver and the pancreas, are important supporters of the digestive system. In the head gut, food is taken hold of and broken up using the teeth. The saliva lubricates the food components, facilitating swallowing. Once they have arrived in the stomach, the chunks of food are processed into bolus and are enriched with gastric juice, which contains acids and digestive enzymes. By means of muscle contractions, the food is transferred into the small intestine, which is relatively short. In the small intestine, bile and pancreatic juice are added, which help to break up and digest proteins, fats and carbohydrates. The large intestine helps to return the water from the non-usable food components. Additionally, water-soluble vitamins, salts and essential fatty acids are absorbed in the large intestine. This serves to densify the residual food components, which are ultimately eliminated again.

Our products – premium wet food

Available in: 200 g cans • 400 g cans • 800 g cans • 125 g pouch

Turkey as mono-protein

A real catch – Venandi Wet Food Turkey is impressive due to its natural and delicate ingredients and contains all the important nutrients. The high meat proportion of the menu comes from just one protein source, which leads to very high compatibility even in the case of cats with a sensitive digestive system.

In addition to fresh muscle meat, nutritious innards are included that cover the need for vitamins and minerals in a natural way.

Natural

Ballpoint pen

Would you also like to keep a record of how your kitten is developing in the first few months? Taking notes is twice as much fun with our Venandi ballpoint pen.

FAQ

What effects do grain and gluten have on cats?

A cat is a carnivore, which means it mostly feeds on meat. As a result, their entire digestive tracts are designed to utilise meat fats and proteins and can utilise these feed ingredients very well. However, it is more difficult for cats with cereals as their relatively short digestive tracts cannot break down and utilise the cereal starch adequately. This can lead to health problems, which is why we decided from the outset to avoid grain and gluten in the feed.

What does premium quality mean?

The meat used for our feed is of premium quality. This means that no slaughterhouse waste, so-called K3 materials or animal by-products such as hooves, sex organs, eyes, fur or brains go into our products. Our demands on the processed materials comply with the regulations prescribed by law in the food industry. This means that meat is continuously cooled during the entire process and is not allowed to exceed the specified maximum values for germ contamination. So, the food is definitely of good quality, and this is verified by strict checks throughout the production process.

How is product quality ensured?

For us, quality assurance starts with selecting the raw materials as they are the basis for the end product later. As a result, we use local ingredients from local farmers as they can be guaranteed to be of a high standard. During the subsequent production process, the ingredients are subjected to regular quality checks – this guarantees high quality without exception.

What does mono-protein mean? What are the benefits for cats?

Mono-protein means that protein components in the feed come from only one type of meat. This leads to significantly better compatibility, even in cats with food allergies and food intolerances.
